## **Chris starts studies in sustainable Architecture - 09/10/07**

LEP is sponsoring in-house graphics and visualisation specialist, Chris Palmar, for The Advanced Environmental and Energy Studies, leading to an MSC in Architecture.

This progressive 2 year part-time programme is delivered at the Centre of Alternative Technology (CAT) in Southern Snowdonia, Wales by CAT staff and specialist visitors from the profession. The leading eco-centre in Europe and also one of the world's most renowned, CAT was founded to develop and prove new technologies which would provide solutions to the problems that are now worrying the world's ecologists.

The Advanced Environmental and Energy Studies programme is validated by the University of East London and examines the relationship between human beings and their environment, and in particular offers an ecological perspective on building. Choice of materials, bioclimatic design, building methods, designing for energy efficiency and the principles and practice of renewable energies form an important part of the programme.
